

Lars Lieker, cooperative engineering student

I started my dual degree course with SAG in 2010, choosing the field of “mechatronics and information technology” with a focus on “electrical engineering and informatics”. After obtaining my bachelor’s degree in 2014, I also completed the master’s course “technical informatics” on a part-time basis. Over the course of my entire studies, SAG has supported me intensively with all projects and problems.

I stayed with SAG after obtaining my master’s degree, as I really enjoy working here. The electronics and software development team is very small. This means that every single member is challenged in many different areas, engaging with a large number of different aspects – our work is very versatile. At the same time, we frequently work with external partners, which requires extensive coordination. This allows us to meet new people and learn new points of view that influence our own work.

Mira Heiligenhaus, cooperative engineering student

My interest in technology developed at school and during a workshop for women interested in STEM.

In 2015, I applied to Schulte-Schlagbaum AG for a cooperative engineering degree in the field of mechatronics and product development.

The support I receive from SAG helps me master my studies more easily, and I enjoy engaging with the theoretical issues in a practical manner here in the company.

Schulte-Schlagbaum AG gives me a great deal of freedom for developing and constructing my own ideas independently. I get to look after my project all the way up to the final, marketable product. My colleagues are always happy to make time for me, answer my questions and help me. The relaxing and pleasant working atmosphere and the friendly attitude of my colleagues ensure that I feel welcome and at ease in the company – and I am convinced that this has been a great choice.
